

Concept course:

successful treatment of wounds

Wound Bed Preparation – T.I.M.E. – Care Cycle – Evidence Based guidelines

This course is the basis for successful treatment of wounds.

Every patient and every wound is specific and needs a specific treatment.

It is essential for every Health Care professional (medical doctor or nurse) to have knowledge about these treatments.

Treating wounds in a **holistic** way starts with a **concept**:

- Wound Bed Preparation
- T.I.M.E.
- Care Cycle principles

The right diagnosis is essential before starting any therapy or treatment.

Unfortunately, nowadays too much attention goes to the choice of wound dressings instead of considering the specific type of wound we are dealing with.

The WUWHS (World Union Wound Healing Society) has created a list of obstacles impairing the normally expected wound healing process of wounds. These statements are supported by meta-analyses and Randomized Controlled Trials and provide a summary of obstacles of wound healing.

It has been scientifically proven that wound healing demands a **holistic** way of treating and increases the outcome and the success ratio dramatically.

GOAL

To provide clear insights in the concept of the holistic approach in wound care.

To explain Wound Bed Preparation – T.I.M.E. – Care Cycle and Evidence Based guidelines.

To teach how to observe wounds in a critical way.

Target group

Medical doctors:
 specialists – general practitioners.
 Nurses.

Level

Basic or advanced (tailor made)

Content

We assure a good balance between a theoretical part and case reports from our own practice. The case reports are visualized and can be discussed in an interactive way. The client has the possibility to provide case reports in advance (14 days) which can be integrated in the course.

We provide digital hand-outs.

Location

We kindly ask our clients to organize the conference room and the technical equipment.
